

The scatter plot displays the relationship between the number of discharges (Berücksichtigte Austritte) on the x-axis and the adjusted rehospitalization rate (Adjustierte Rehospitalisationsrate %) on the y-axis. A horizontal red line at approximately 12.2% represents the benchmark rate for all hospitals/clinics. Data points are categorized as follows:

- Ergebnis im Normbereich (Grey):** Most data points fall within the normal range, clustered between 10% and 16% rehospitalization rate for 0 to 1,000 discharges.
- Ergebnis tiefer als Vergleichswert (Green):** Three points are below the benchmark line, indicating better performance than the average.
- Ergebnis höher als Vergleichswert (Orange):** Several points are above the benchmark line, indicating higher rehospitalization rates than the average.

The specific hospital being evaluated is highlighted with a red circle at approximately 150 discharges and a 12.8% rehospitalization rate, which is slightly above the benchmark.
