

The scatter plot displays the relationship between the adjusted rehospitalization rate and the number of discharges considered. The y-axis, 'Adjustierte Rehospitalisationsrate %', ranges from 1 to 7. The x-axis, 'Berücksichtigte Austritte', ranges from 0 to 16,000. A red horizontal line at approximately 4.4% indicates the average rate for all hospitals/clinics. Data points are categorized as follows:

- Ergebnis im Normbereich (Grey):** Most data points fall within this range, showing a general downward trend as the number of discharges increases.
- Ergebnis tiefer als Vergleichswert (Green):** These points are generally located below the average line, indicating better performance (lower rehospitalization rates) than the average.
- Ergebnis höher als Vergleichswert (Orange):** These points are generally located above the average line, indicating worse performance (higher rehospitalization rates) than the average.

A specific data point at approximately (1500, 3.8) is highlighted with a red circle, indicating a hospital/clinic with a lower rehospitalization rate than the average.
